# Electronic Instrumentation 

Quiz 2
Fall 2021

# Name <br> $\qquad$ <br> <br> Section <br> <br> Section <br> $\qquad$ <br> Question I (20 points) <br> $\qquad$ <br> Question II (20 points) <br> $\qquad$ <br> <br> Question III (20 points) <br> <br> Question III (20 points) <br> $\qquad$ <br> Question IV (20 points) <br> $\qquad$ <br> LMS Question is worth an additional 20pts 

Total (80 points)

On all questions: SHOW ALL WORK. BEGIN WITH FORMULAS, THEN SUBSTITUTE VALUES AND UNITS. No credit will be given for numbers that appear without justification. Read the entire quiz before answering any questions. Also it may be easier to answer parts of questions out of order. If you run out of room to write your answers on the printed quiz, please attach scratch paper with additional answers rather than writing on the back of the exam pages.

You must include units.

## I. Thè venin Equivalent And Voltage Follower (20 points)

The Thevenin Equivalent Circuit consists of a voltage source in series with a resistor, which provides a very simple replacement for much more complex circuits. If we have this simple source, analyzing complex loads becomes quite easy.
a) (5 pts) Two measurements are performed in order to determine the unknowns, Vth and Rth. In the first measurement, the load resistor $R L$ is $1 \mathrm{k} \Omega$. A second measurement is made in which RL is changed to $8 \mathrm{k} \Omega$. For these two measurements, the voltage across the load resistor, VL , is experimentally found to 1.0 V and 4 V respectively as shown in the table below. Using these two measurements, find the two unknowns, Rth and Vth.

| RL (in ohms) | VL (in volts) |
| :---: | :---: |
| 1 k | 1.0 |
| 8 k | 4 |

You must include units.

b) (4 pts) Now consider a different circuit, shown above. Find and sketch the Thèvenin equivalent voltage source (which will include Vth and Rth) for the part of the circuit inside the gray dotted box. (This includes R1, R2, and V1).
c) (4 pts) Now find and sketch the Thèvenin equivalent voltage source for the entire circuit. (This includes V1, R1, R2, R3, and R4.)
d) (3 pts) Using the Thèvenin equivalent circuit obtained in part c , find the current through the load resistor when $R L=1 \mathrm{k} \Omega$.

e) (4 pts) An ideal voltage follower is now placed between R2 and R3 as shown above. What is the new current through the load resistor?

## II. Strain Gauges and Bridges (20 points)

a. (3 pts) In the strain gauge above, suppose that R3 has a value of $320 \Omega$. What is the differential voltage output (V1 - V2)?

b. (7 pts) Now we look at a new strain gauge connected to a differential amplifier as shown on the bottom of the previous page. If the voltage Vout is 800 mV , find the value of R3. (Assume that the op amp is a rail-to-rail chip, meaning that the output can reach the voltage of the power supplies; otherwise assume it is ideal.)
c. (4 pts) Suppose that the value of R3 in part b varies from $450 \Omega$ to $550 \Omega$ during normal operation. Assuming that you keep the values of R7 and R8 equal, what is the maximum resistance that can be chosen for R7 and R8 without causing saturation of the op amp output?
d. (2 pts) In Experiment 5 and Project 2, you were asked to consistently use the same cantilever beam and strain gauge each time you came to class or open shop. Why was this the case?
e. (2 pts) In Experiment 5 and Project 2, the bridge had two strain gauges in it, as shown below. One was on the top of the beam and the other was on the bottom. What is the usefulness in having two strain gauges?

f. (2 pts) Suppose that the voltage output of the circuit described in part b needs to be "rezeroed" - specifically, the beam is at rest but the circuit is outputting a small positive voltage and you need to make the voltage read 0V. Describe a change you would make to the circuit to achieve this.
III. Operational Amplifier Applications (20 points)
a. (3 pts) What type of amplifier is each circuit?

| A | B |
| :--- | :--- |
| C | D |
| E | F |

You must include units.
b. (6 pts) Design a non-inverting amplifier circuit with a gain of 20, specify resistor values, the resistors must have values of $\geq 1 \mathrm{k} \Omega$. Draw the circuit schematic. Be sure to label the input and the output. You can assume any resistor value is available.
c. (6 pts) Using the ideal op amp rules, "Op Amp Analysis Rules", determine for each circuit below the values for $\mathrm{V}+, \mathrm{V}-$, and Iin. These circuits aren't connected to each other in any way. As with all problems, include units.

Left Circuit:
Right Circuit:
$\mathrm{V}+=$ $\qquad$

$$
\mathrm{V}+=
$$

V- = $\qquad$
V- = $\qquad$
$\mathrm{I}_{\mathrm{in}}=$ $\qquad$

$$
\mathrm{I}_{\mathrm{in}}=
$$

$\qquad$
d. (5 pts) For the circuit shown on the right:
i) (1pt) For what range of frequencies will this behave as an integrator? Provide the answer in Hertz.

ii) (1pt) Will it be a reasonable integrator if V1 is a sinewave at 2 kHz ?
iii) (3pts) For this part assume it is a good integrator. If V1 is a sinewave with an amplitude of 0.5 V and a frequency of 2 kHz and a phase angle at $\mathrm{t}=0$ or 0 degrees, what is Vout in the form of $V o u t=V_{a m p} \sin (\omega t+\theta)$. In other words: Give $V_{a m p}, \omega$, and $\theta$ of the output.

## IV. Concepts, Troubleshooting and Data Analysis (20 points)

a. (7 pts) Real components compared to ideal: In Experiment 5 you built and modeled the circuit on the right.
i. (1 pt) For the LTspice model you included R1. But you didn't put a resistor there when you built the
 circuit. Why not?
ii. (1 pt) Energy is lost as a function of time in the harmonic oscillator circuit as Vout was oscillating. Which component in the circuit shown in part i. of this problem causes the energy loss?
iii. (2 pts) Continuing with the energy loss question, will the energy loss be most rapid when the current in the inductor is at the maximum, or at 0A or energy loss doesn't depend on which part of the oscillation? Circle one.
peak energy loss at:
$\underline{I}_{\underline{L}}$ is at a peak $\underline{\mathrm{I}}_{\underline{L}=0}=$ doesn't depend on which part of an oscillation (circle one)
iv. (3 pts) The inductor used for this circuit was a 1 mH inductor. If by mistake your partner used a 10 mH inductor, would the resonant frequency go up or down, and by what percentage would the frequency change, to the nearest $1 \%$ ?

b. (4 pts) The plot shown above represents data taken from the accelerometer on a beam after it has been integrated by an op-amp circuit. Note that there is a dc offset, typical of integration. Find the decay constant $\alpha$ and the angular frequency $\omega$ for this data. You must mark the data points on the plot that you use for your answer.
c. (4 pts) Classroom Knowledge and Tasks: True or False, circle one.
i. Before beginning a lab, at least one team member must read over and be generally acquainted with the experiment or project write-up and the other required reading materials listed on the EILinks page.

## True or False

ii. The velocity of the beam can be measured by using a differentiator op amp circuit with the accelerometer.

## True or False

iii. When asking for a signature on a check off page you show the instructor a live simulation or instrumentation board measurement. Live refers to it running on your computer it the time of the check off.

## True or False

iv. You don't need to have done hand-drawn schematics for the first checkoff of an experiment.

True or False

$\mathrm{V}_{\mathrm{S}}= \pm 15 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.
Table 1.

| Parameter | Symbol | Test Conditions | OP27A/OP27E |  |  | OP27G |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

d. (5 pts) Part of the data sheet for the OP27 is shown. Use this to answer the following questions. Look at typical values for the G version, OP 27 G .
i. If the OP 27 G is powered by $\pm 15 \mathrm{~V}$ supplies and has a $10 \mathrm{k} \Omega$ load, what are the expected maximum and minimum output voltages you can expect to achieve? (1pt)
ii. If the load is changed to $600 \Omega$, what is the expected max and min output voltages? (1pt)
iii. For the ideal op amp model what are the value of $\mathrm{I}_{+}$and $\mathrm{V}_{+}$as shown in the figure on the right?(1pt)
iv. The data sheet lists the actual expected values of $\mathrm{I}_{+}$as some-
 thing called INPUT BIAS CURRENT. Using the largest typical value of the INPUT BIAS CURRENT, what would be the value of V+ for this circuit? (2pt)
v. (2pt) Extra credit: Given your answer above, what would be the error in Vout due to the INPUT Bias Current?
